
DRISPAC

DESCRIPTION Drispac is a high molecular weight, polyanionic cellulose (polymer). It is an off-white, free flowing powder of high purity. It is available in Regular and Superlo grades.

APPLICATION Drispac is designed primarily as a fluid loss reducer in salt water muds. As Drispac Regular, this polymer also provides secondary viscosity. (Drispac Regular has approximately twice the viscosifying power in fresh water mud systems when compared to equal concentrations in saline water based mud systems). When fluid loss control without additional viscosity is required, Drispac Superlo should be used.

Both Drispac Regular and Superlo are used in concentrations of 3-10 kg/m³ in saline water based muds whereas fresh water based mud systems normally use concentrations of 1-3 kg/m³.

Drispac is also very effective as a fluid loss control additive in inhibitive mud systems. However, for any mud system, Drispac can be expected to lose some effectiveness in high calcium or magnesium environments.

HANDLING Drispac should be stored in a dry location. In order to avoid lumping it is added to the mud system through the hopper at thirty to forty minutes per sack.

WHMIS Not Controlled

TDG Not Regulated

PACKAGING 50 lb sack

NOTE: See disclaimer for supplier responsibility.
